**This course provides the student with advanced knowledge which concerns applications of Nuclear Physics. More specifically, the aim of the course is to develop an understanding of the way in which basic principles and methods of Nuclear Physics can be used, so that needs and activities of the society are covered. After successful completion of the course, the student will be able to:**

- **Recognize and relate the basic principles of Nuclear Physics with the corresponding technological applications.**
- **Describe the properties of the nucleus and the laws which govern the nuclear phenomena which are used in a variety of applications in technology, energy, health, environment and radio-ecology.**
- **Describe the principles of operation of detection systems of ionizing radiation.**
- **Realize the interaction of any kind of radiation with matter.**
- **Suggest the proper nuclear method for solving of a technological problem, according to the material covered in this course.**
- **Describe the basic nuclear analytical techniques such as AMS, PIXE, RBS, NRA, XRF, neutron scattering etc.**
- **Describe the basic techniques of radio-dating.**
- **Describe the basic principles of dosimetry and radioprotection.**
- **Realize the role of Radon in Health Physics and its applications in Geology.**
